# Agenda

Introduction

Malware public information

TRIANA

Conclusions

# Agenda

One new malware every 2 seconds

It's like epidemic

Many variety of vectors:

- APT

- Drive by downloads

- USB

- Rootkits, Bootkits, etc...

# Introduction

Many variety of technology:

- MS Office

- PDF

- Windows

- Apple based

- Mobile

Big problem when analyze a lot of samples

# Introduction

- Some questions:
  - The Malware analyst have tools to perform analysis?
    - Like a sandbox, scripts, little unit tools
  - The Malware analyst have a deep know in the malware analysis art?
    - Static analysis, dynamic analysis, reversing, etc..
  - It's possible reduce the analysis time?
  - Is a sample available for analyze?

# Introduction

- Is a sample available for analyze?

Hello list,

I'm looking for any samples of Zitmo, Spitmo, or Citmo you may have.

Best regards,

--

Looking for MD5 DAA758DD53EFDD12104C130F8A56313C

Hi All,

I'm looking for a couple of samples (IDS testing).

- Zeroaccess
- Dorkbot
- Andromeda
- Jeefo
- DirtJumper
- Pushdo
- Smoke
- Tedroo
- Lethic

# Malware Public Information

- Why need MD5 instead of SHA1 or SHA256?
  - Easy: For URL based search

## Retrieving file scan reports

In order to retrieve a scan report on a given file you must perform an HTTP POST request to the following URL:

<https://www.virustotal.com/vtapi/v2/file/report>

With the following two HTTP POST parameters:

- **resource:** a md5/sha1/sha256 hash will retrieve the most recent report on a given sample. You may also specify a *scan\_id* (sha256-timestamp as returned by the file upload API) to access a specific report. You can also specify a CSV list made up of a combination of hashes and *scan\_ids* (up to 4 items with the standard request rate), this allows you to perform a batch request with one single call.
- **apikey:** your API key.

# Malware Public Information

## [DNSMalware]

mhr = .malware.hash.cymru.com

sans = .md5.dshield.org

owasp = .hash.sapao.net

## [Malware]

CleanMX = <http://support.clean-mx.com/clean-mx/viruses.php?md5={0}>

# DEMO

Malware based search

# WHERE IS MY SAMPLE

- In many cases:
  - The sample is located in public site
  - The sample is located in hacking site
  - The sample is located in Web Access tool (Like VT, Malwr, etc...)
  - The sample is located in a public repository

# WHERE IS MY SAMPLE

- IP, Host, Domain:
  - Useful for discover new samples
    - Whois
    - Domain Lookup
    - Etc...
  - Useful for discover APT Threats, Malware located by country, etc...

# DEMO

Malware sample search

# TRIANA

- Python based script:
  - Perform HASH and File Hash search
  - Many public information reference
  - Ability to download the sample if found it
  - Many sources → One JSON source
  - DOCX Report

# TRIANA

- IP & Domain collector:
  - Check in IP and Domain reputation lists
- Plugin based:
  - VirusTotal plugin
  - Malwr plugin
  - ThreatExpert plugin
  - Etc, etc...

```

# CONCLUSIONS

- It's possible reduce time in malware analysis
  - Automate unit test
  - Automate malware analysis
  - Automate static analysis
  - Automated search based malware
- It's useful to attach like annex
  - JSON results
  - DOCX report
- It's useful to search malware
  - Many public information sites
  - Different public sandbox perform different analysis
  - Many public repositories

THANKS ;)

Juan Garrido
